Claim 43; Page 132; Opp; English.

The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restenosis, metastasis, growth and/or replication of

                          cc important in physiological phenomena such as cell rolling, metastasis and cl inflammation, where the epitope is capable of being bound by an antibody, ct its antigen-binding fragment or its complex comprising at least one cc antibody or its binding fragment having a first hypervariable region. The cd isease, thrombosis, restenosis, metastasis, growth and/or replication of ct tumour or leukaemia cells, increase in number of tumour or leukaemia cc cells in a patient, cell-cell, cell-matrix, platelet-matrix, platelet-platelet and/or cells-platelet adhesion or aggregation, for increasing completed and/or cells to damage by anti-disease, anti-cancer or anti-cc leukaemia agents, or for decreasing the number of tumour or leukaemia cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diagnosing and treating cd iseases such as cancer, leukaemia, autoimmune diseases, inflammatory cd iseases, cardiovascular diseases such as myocardial infarction, cretinopathic diseases caused by sulphated tyrosine-dependent protein-cc of the invention sequence represents a human epitope sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; epitope; cancer; tumour; cell rolling; inflammation; metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leukaemia; inflammatory disease; cardiovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated epitope present on cancer cells and important physiological phenomena such as cell rolling, metastasis and inflammation, for treating autoimmune, inflammatory or cardidiseases, and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lazarovits J, Hagai Y, Szanthon E, Richter T,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           31-DEC-2001; 2001WO-US049442.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         04-DEC-2002 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                          The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, cell-matrix, platelet-matrix, platelet-platelet and/or cell-platelet adhesion or aggregation, for increasing mortality of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diseases, inflammatory diseases such as cancer, leukaemia, autoimmune diseases, inflammatory cardiovascular diseases such as myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; epitope; cancer; tumour; cell rolling; inflammation; metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leukaemia; inflammatory disease, cardiovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.
                                                               protein interactions. of the invention
                                                                                   retinopathic diseases and other diseases mediated by abnormal function and diseases caused by sulphated tyrosine-dependent protein interactions. This sequence represents a human epitop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated epitope present on cancer cells and important physiological phenomena such as cell rolling, metastasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             29-DEC-2000; 2000US-00751181.

                                                                                                                                                                                                                                                    The present sequence is that of a peptide sequence from human glycoprotein GPIb-alpha. The peptide is sulfated at the Tyr residue at position 4 of the sequence. It was one of a set of sulfated and non-sulfated peptides used in an example from the invention to determine the epitope for scFv antibody L32 ADJ57363. The results showed that the L32 epitope is located between amino acids 1 and 17 of mature P-selectin glycoprotein ligand-1 (PSGL-1) in which there is a cluster of negatively charged amino acids. The invention provides antibodies or their fragments that have the binding specificity of L32. These are useful in therapeutic, diagnostic, prognostic or staging methods for diseases such as cancer, including tumour growth and metastasis, leukaemia, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antibody or its fragment that binds to an epitope of P-Selectin-Glycoprotein Ligand-1, useful for diagnosing/prognosing inflammation, infection, auto-immune disease, metastasis, tumor/leukemia cell in
                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 8;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Levanon A, Ben

Sub- fragments such as these may be used in the construction of a bifunctional antithrombotic molecule. The bifunctional molecule inhibits activation and/or adhesion of platelets to a damaged or diseased vascular surface. The molecule contains two linked domains, the first inhibits binding of thrombin to GPIb-alpha, and the other inhibiting binding of von Willebrand factor (vWF) to GPIb-alpha. The molecule may be used to inhibit thrombosis and cell activation of endothelial cells, fibroblasts or smooth muscle cells. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bifunctional antithrombotic molecule and antithrombotic polypeptide - used to inhibit thrombosis, cell activation and tumour metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Platelet; glycoprotein Ib-alpha; GPIb-alpha; von Willebrand factor; bifunctional antithrombotic molecule; inhibition; activation; vWF; adhesion; vascular surface; thrombin; thrombosis; endothelial cells; fibroblasts; smooth muscle cells.

It may be linked to a second peptide from the 45 kD N-terminal tryptic fragment of GPIb alpha. The peptide inhibits binding of vWF to GPIb. It can be used to inhibit activation, aggregation and/or adhesion of platelets, esp. for inhibition of thrombosis. Truncated versions of the peptide may also be used, esp. AAS 281-285. See also AAR13128-R13138. (Updated on 25-MAR-2003)

Sub- fragments such as these may be used in the construction of a bifunctional antithrombotic molecule. The bifunctional molecule inhibits activation and/or adhesion of platelets to a damaged or diseased vascular surface. The molecule contains two linked domains, the first inhibits binding of thrombin to GPIb-alpha, and the other inhibiting binding of you willebrand factor (vWF) to GPIb-alpha. The molecule may be used to inhibit thrombosis and cell activation of endothelial cells, fibroblasts or smooth muscle cells. (Updated on 25-MAR-2003 to correct PN field.)
                                                          A human antithrombin III (AT III) mutant, comprising a carboxy-terminal sulphated tyrosine peptide extension, i.e. the present peptide, can be used to prevent and/or treat thrombotic diseases
                                                                                                                                                                                                                                                       Human antithrombin sulphated tyrosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bifunctional antithrombotic molecule and antithrombotic polypeptide -

Sequence 18

```
The invention relates to an isolated epitope present on cancer cells and CC important in physiological phenomena such as cell rolling, metastasis and CC inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one CC antibody or its binding fragment having a first hypervariable region. The CC epitopes are useful for inhibiting cell rolling, inflammation, autoimmune CC disease, thrombosis, restenosis, metastasis, growth and/or replication of CC tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia CC cells in a patient, cell-cell, cell-matrix, platelet-matrix, platelet-cC platelet and/or cell-platelet adhesion or aggregation, for increasing CC mortality of tumour or leukaemia cells, for increasing the susceptibility CC of diseased cells to damage by anti-disease, anti-cancer or anti-CC mentioned purposes. The epitopes are useful for diagnosing and treating CC diseases such as cancer, leukaemia, autoimmune diseases, inflammatory CC retinopathic diseases and other diseases mediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein-protein interactions. This sequence represents a human epitope sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                             The invention relates to an isolated epitope present on cancer cells and C important in physiological phenomena such as cell rolling, metastasis and c inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune cd leease, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells in a patient, cell-cell, cell-matrix, platelet-matrix, platelet platelet and/or cell-platelet adhesion or aggregation, for increasing comortality of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diseases, inflammatory calseases such as cancer, leukaemia, autoimmune diseases, inflammatory customental diseases and other diseases mediated by abnormal platelet function and diseases caused by sulphated tyrostine-dependent protein-protein interactions. This sequence represents a human epitope sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                The invention relates to an isolated epitope present on cancer cells and CC important in physiological phenomena such as cell rolling, metastasis and CC inflammation, where the epitope is capable of being bound by an antibody, CC its antigen-binding fragment or its complex comprising at least one CC antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune CC disease, thrombosis, restenosis, metastasis, growth and/or replication of CC tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia CC cells in a patient, cell-cell, cell-matrix, platelet-matrix, platelet-matrix, platelet-cells in a patient, or leukaemia cells, for increasing the susceptibility CC of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above CC mentioned purposes. The epitopes are useful for diagnosing and treating CC diseases such as cancer, leukaemia, autoimmune diseases, inflammatory CC diseases, cardiovascular diseases such as myocardial infarction, CC retinopathic diseases and other diseases mediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein-cell for the invention. This sequence represents a human epitope sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                             example from the invention to determine the epitope for scFv antibody L32 ADJ57363. The results showed that the L32 epitope is located between amino acids 1 and 17 of mature P-selectin glycoprotein ligand-1 (PSGL-1) in which there is a cluster of negatively charged amino acids. The invention provides antibodies or their fragments that have the binding specificity of L32. These are useful in therapeutic, diagnostic, prognostic or staging methods for diseases such as cancer, including tumour growth and metastasis, leukaemia, autoimmune disease and
                                                                                                                                                                                                                                                                                              The present sequence is that of a peptide sequence from human glycoprotein GPIb-alpha. The peptide may be non-sulfated or su one or more of the Tyr residues at positions 9, 11 and 12 of usequence. These sulfated and non-sulfated peptides were used sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel antibody or its fragment that binds to an epitope of P-Selectin-Glycoprotein Ligand-1, useful for diagnosing/prognosing inflammation, infection, auto-immune disease, metastasis, tumor/leukemia cell in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-JUL-2002; 2002US-00189032

cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diagnosing and treating diseases such as cancer, leukaemia, autoimmune diseases, inflammatory diseases, cardiovascular diseases such as myocardial infarction, retinopathic diseases and other diseases mediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein protein interactions. This sequence represents a human epitope sequence of the invention
                                                                                                                                                                                                                                                              The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia platelet and/or cell-cell, cell-matrix, platelet-matrix, platelet-glatelet and/or cell-platelet adhesion or aggregation, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-leukaemia agents, or for decreasing the number of tumour or leukaemia cells, the number of tumour or leukaemia cells to damage by anti-disease, anti-cancer for the above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; epitope; cancer; tumour; cell rolling; inflammation; metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leukaemia; inflammatory disease; cardiovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, for treating autoimmune, inflammatory or cardioval

SUBCLIULAR LOCATION: Nuclear (Probable).

TISSUB SPECIFICITY: In 8.5 day embryos, expressed in midbrain, anterior hindbrain and ventral forebrain. In 9 day embryos, expressed throughout ventral anterior half of embryo including midbrain-hindbrain junction, ventral midbrain, diencephalon and forebrain. At 10.5 days, distribution is more widespread with expression also found in developing limb buds. Widely expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: Contains 3 C2H2-type zinc fingers.
